

Samir Banerjee

Senior Consultant, Capgemini
Technology Services India
Limited

PROFILE SUMMARY

I have got a total of 13 years of experience . I have worked on multiple projects in Capgemini and prior to that. My relevant work experience on Python, PySpark and Databricks is 4 years. I have got a good knowledge of SQL and Data Warehousing concepts. I have used SQL , Python ,PySpark ,Databricks and Snowflake while working on projects related to Data-Warehousing, Data-Engineering and migration. I have knowledge of Cloud platform services like Azure, Databricks and Snowflake while working on live projects. In my current project I am working as a Databricks developer, developing end-to-end parameterized notebooks using PySpark for loading data filtered from the Databricks source to the intermediary raw table, and from the raw to the result table after transformations. The final output is also saved into a csv file stored in the Azure Data Lake container and NAS folder. I automate this notebook framework by creating Databricks jobs. I also create ADF pipelines for data ingestion.

EDUCATION

2011	MCA Netaji Subhash Open University, Kolkata
2002	B.Com Calcutta University
1998	XIIth English
1996	Xth English

WORK EXPERIENCE

Mar 2022 - Present	Senior Consultant, Capgemini Technology Services India Limited Capgemini I have worked on multiple Capgemini projects. I have used SQL, Python, PySpark, Azure Databricks, Azure Data Factory, Github, Azure Devops and some Snowflake while working on projects related to Data Engineering and migration. I have good knowledge of cloud platform services like Azure , Databricks and Snowflake while working on live projects. My current project is a migration project from on-premises legacy databases to the Azure cloud. I am working as a Databricks developer, developing end-to-end parameterized notebooks using PySpark for loading data filtered from the Databricks source to the intermediary raw table, and from the raw to the result table after transformations. The final output is also saved into a csv file stored in the Azure Data Lake Storage container and NAS folder. I automate this notebook framework by creating Databricks jobs that push data from the volume to the source table and then from the source to the final result table and also saved into a output file. The jobs are either scheduled to run on time basis or triggered by events

such as a new entry into the source table. I also create Azure Data Factory pipelines for ingesting data from NAS file locations to the Databricks managed volume. These are based upon events like file arrival.

Subject Matter Expert

Anunta Technology Management Services

•This was a analytics project where I used Python and SQL for descriptive analytics. For relational datasets I used SQL for aggregations, joins, summarizations, slicing based on date ranges, rollups and visualizations using Power BI. •For non-relational data I used Pandas for normalizing data into the data frames and then used functions for basic joins aggregations and slicing. •I used Matplotlib and Seaborn libraries for visualizations. •One of the highlights was that I created and trained data models on experimental basis to predict customer base and market share using libraries like Scikitlearn and Stats model.

Feb 2019 - Apr 2020

Senior Software Engineer

Gap Bridge Software Services

•I created stored procedures to capture data from the source and implement business logic. •I also refactored existing stored procedure code wherever feasible. •I also created views and common table expressions inside them to implement the transformation logic on the data coming from the staging layer. •I tested in the QA environment before deploying to the production using GitHub. •In the later part of the project, I did some amount of DBA work where I created SCD type O2 tables, indexes and index rebuilding.

Mar 2017 - Jan 2019

Senior Software Engineer

Clover Infotech

This was a Datawarehouse-ETL project which aimed at converting a part of the OLTP database to OLAP model. •I created stored procedures to capture data from the source and implement business logic. •I also refactored existing stored procedure code wherever feasible. •I also created views and common table expressions inside them to implement the transformation logic on the data coming from the staging layer. •I tested in the QA environment before deploying to the production using GitHub.

May 2016 - Feb 2017

Senior Software Engineer

CredenTek Software & Consultancy Pvt. Ltd.

•I created stored procedures in the SQL database to implement business logic for C#.net UI based applications. •I also created, tested and implemented Windows jobs which executed PL/SQL code in the Oracle databases to automate financial transactions on a weekly and monthly basis.

Jul 2014 - May 2016

Software Engineer

Comtel Technologies Pvt. Ltd.

•I created stored procedures in the SQL database to implement business logic for C#.net UI based applications. •I also created, tested and implemented Windows jobs which executed PL/SQL code in the Oracle databases to automate financial transactions on a weekly and monthly basis.

Aug 2012 - Jul 2014

Software Engineer

Protex Computers Pvt. Ltd.

This was a ERP project of a PSU (Coal India Ltd.) . I worked on the PIS(Personnel Information System) and created complex PL/SQL queries using table joins and aggregations on client databases. I extracted data related to employee salary, leave ,

retirement, transfer, promotion and exit and exported them to CSV files for presentation to the client. I also created user friendly reports using Oracle report builder and deployed them on the server. These reports were an integral part of the Coalnet application reporting framework.

May 2008 - Aug 2012

Technical Associate

HMV

I worked in the role of a Technical Support Executive from 2008 — 2012 at client site HMV and its various outlets. Responsibilities included network security and audit and other types of ERP software app installations , configuration, troubleshoot and technical support.

Projects

256 Days

Aladdin

This is a migration project from on-premises legacy databases to the Azure cloud. I am working as a Databricks developer, developing end-to-end parameterized notebooks using PySpark for loading data filtered from the Databricks source to the intermediary raw table, and from the raw to the result table after transformations. The final output is also saved into a csv file stored in the Azure Data Lake container and NAS folder. I automate this notebook framework by creating Databricks jobs that push data from the volume to the source table and then from the source to the final result table and also saved into a output file. The jobs are either scheduled to run on time basis or triggered by events such as a new entry into the source table. I also create Azure Data Factory pipelines for ingesting data from NAS file locations to the Databricks managed volume. These are based upon events like file arrival.

153 Days

FDL

This project was a migration project, migrating data from on-premises legacy database, data warehouses, cloud-based Lakehouse, legacy DB systems and financial applications to the Databricks bronze layer staging tables and then to the Silver layer tables.

212 Days

SIS

Migration project from on-premise, legacy SQL databases to Snowflake cloud. I worked in the role of a developer in this migration project. I used Snowflake stored procedures for necessary transformations and DQ checks in the data coming from the landing to the curated tables. Development and testing were mainly done on the Dev environment and then code deployed to production using Github actions. Development cycle was based on Agile methodology. I attended daily scrum calls and gave status updates on Jira tickets

244 Days

BNPL

This project was a cloud warehouse project. Data from the ADLS container was extracted through the ADF, staged in the Databricks bronze layer tables, filtered and moved to the silver layer and then aggregated in the gold layer tables before being moved to the Azure Synapse Analytics materialized views or CTAS tables. In the Azure Synapse Analytics layer T-SQL procedures did a rule-based validation like row count check to verify with the upstream source, null check to ensure KPI columns contains zero or safe defaults instead of nulls and threshold check. This data was later used in the PowerBI dashboard.

153 Days

Individual Retirement Arrangement

This was a data engineering project with multiple ETL pipelines extracting and moving data from source to downstream applications. This was replicated across all ETL pipelines and helped to improve performance.

487 Days

Identity Management

Data engineering project which later metamorphosed into a analytics project. I worked on this project in multiple roles. First as a team lead and developer I created a data pipeline that extracted data using API calls from the Kafka, transformed the data and moved it to Elasticsearch. This I was able to complete before the deadline. In second role I worked as a SQL developer and led a team. This was a analytics project and we had to get the requirements from the client's analyst and transform the data based upon the given logic. Source was SQL Server, and the target was Azure CosmosDB. Informatica was used for ETL. I created table expressions to implement the logic and deployed using Github actions. Then executed the Informatica job to carry the transformations into Cosmos DB.

31 Days

Retail Analysis with Walmart(Capstone project)

The aim of this project was to overcome the business challenge faced by Walmart, due to unforeseen demands and out-of-stock issues. Walmart would like to predict the sales and demand accurately. Basic analytical tasks performed using Pandas and Matplotlib library included: To find out stores with maximum sales. To find out which store had maximum standard deviation i.e., the sales vary a lot. Also, find out the coefficient of mean to standard deviation. To find out which stores had good quarterly growth rate in Q32012. To find out holidays which have higher sales than the mean sales in non-holiday season for all stores together. To provide a monthly and semester view of sales in units. For building, training and testing of Prediction Models Scikit-Learn, Matplotlib and Statsmodel libraries were used. Tasks included: Linear Regression-Analyze whether CPI, unemployment and fuel prices have any impact on sales. Change dates into days.

699 Days

Investment Management

This was a analytics project where I used Python and SQL for descriptive analytics. For relational datasets I used SQL for aggregations , joins, summarizations, slicing based on date ranges, rollups and visualizations using PowerBI. For non-relational data I used Pandas for normalizing data into the dataframes and then used functions for basic joins aggregations and slicing. I used Matplotlib and Seaborne libraries for visualizations. One of the highlights was that I created and trained data models on experimental basis to predict customer base and market share using libraries like Scikitlearn and Stats model.

304 Days

Retail lending

This was a EDW project. I created stored procedures to capture data from the source and implement business logic. I also refactored existing stored procedure code wherever feasible. I also created views and common table expressions inside them to implement the transformation logic on the data coming from the staging layer. I tested in the QA environment before deploying to the production using Github Actions. In the later part of the project, I did some amount of DBA work where I created SCD type O2 tables , indexes and index rebuilding.

699 Days

Coal Net

This was a ERP project of a PSU (Coal India Ltd.) . I worked on the PIS(Personnel Information System) and created complex PL/SQL queries using table joins and aggregations on client

databases. I extracted data related to employee salary, leave , retirement, transfer, promotion and exit and exported them to CSV files for presentation to the client. I also created user friendly reports using Oracle report builder and deployed them on the server. These reports were an integral part of the Coalnet application reporting framework.

COURSES & CERTIFICATIONS

- Certification on Machine Learning With Python.(Certificate code:2432060)
- Certified as Oracle Database SQL Expert (IZO-047, Testing ID: OC0989907) (Valid upto December 2017)
- Microsoft Certified: Azure Data Engineer Associate (Valid upto August 2025)
